

Helping You Make Good Decisions

summary

AMDG is committed to helping you make good decisions about how to make your building project green-friendly. A tree illustrates three broad levels of implementation available to you. At the bottom of the tree are the low hanging fruit. This level of green implementation includes options that are sensible for everyone to include in their building project. Many of these options are even required by code in order to provide a standard of health and sensitivity to the environment. At the tree top are the cutting edge, upper echelon, high cost options available to those desiring exceptional environmental care. At the heart of the tree, AMDG works to prioritize what components would add the most value to your building through careful analysis and evaluation. Regardless of what area of the tree best represents your building project, AMDG will lead, guide and serve you in making good green decisions.
